

## Documentation of Bioengineering Projects in North Germany

In the stage of planning and prior the actual construction, the question comes up, whether or not the method and the design will prove and how this will stand over the years, what will be possible consequential effects, what kind of maintenance and up keeping became necessary and last not least, did the constructional measures meet the expectations.

The following documentation can answer at least some of these questions by the aid of pictures. The projects originated from 1983-2003. They may be an example for projects with similar requirements and objectives. In close coordination with designers, expert consultants and clients, products and procedures developed by Lothar Bestmann where used for these jobs.

It is the meaning of this report to show what kind of changes happened over the years. Pictures are worth more than thousand words. Details and further information are available upon request.

May 2008

Dipl. Eng. Lothar Bestmann
